21 North Design Services, LLC (21NDS) completes another chutework project.
21NDS completed another chutework project for a US based engineering firm. The work that was awarded to 21NDS included four(4) main head chute assemblies for 72" conveyors, and the associated transfer chutes. The US based engineering firm required the services of **21NDS** to maintain the necessary project deadline. The chutework was designed to control **PRB Coal** at a rate of 1500 TPH per conveyor through the transfer station.

21NDS has extensive experience designing chutework systems. **PRB Coal** requires special design consideration to protect the safety of maintenance personnel, as well as the system itself. **21NDS** also has the capabilites to render and animate live product flowing through chutework. The ability to design material handling projects with **Live Flow Animation** has proven **21 North Design Services, LLC** has the experience for that next challenging project.
